Information	-

Overview	This manual contains general procedures that apply to Baldor Motor products. Be sure to read and understand the Safety Notice statements in this manual. For your protection, do not install, operate or attempt to perform maintenance procedures until you understand the Warning and Caution statements. A Warning statement indicates a possible unsafe condition that can cause harm to personnel. A Caution statement indicates a condition that can cause damage to equipment.
Important:	 This instruction manual is not intended to include a comprehensive listing of all details for all procedures required for installation, operation and maintenance. This manual describes general guidelines that apply to most of the motor products shipped by Baldor. If you have a question about a procedure or are uncertain about any detail, Do Not Proceed. Please contact your Baldor distributor for more information or clarification. Before you install, operate or perform maintenance, become familiar with the following: NEMA Publication MG-2. Safety Standard for Construction and guide for Selection, Installation and Use of Electric Motors and Generators. IEC 34-1 Electrical and IEC72-1 Mechanical specifications ANSI C51.5, the National Electrical Code (NEC) and local codes and practices.
	Limited Warranty
	www.baldor.com/support/warranty_standard.asp
Safety Notice:	<u>se:</u> This equipment contains high voltage! Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt installation, operation and maintenance of electrical equipment.
	Be sure that you are completely familiar with NEMA publication MG-2, safety standards for construction and guide for selection, installation and use of electric motors and generators, the National Electrical Code and local codes and practices. Unsafe installation or use can cause conditions that lead to serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.
WARNING:	Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment.
WARNING:	Disconnect all electrical power from the motor windings and accessory devices before disassembly of the motor. Electrical shock can cause serious or fatal injury.
WARNING:	Be sure the system is properly grounded before applying power. Do not apply AC power before you ensure that all grounding instructions have been followed. Electrical shock can cause serious or fatal injury. National Electrical Code and Local codes must be carefully followed.
WARNING:	Avoid extended exposure to machinery with high noise levels. Be sure to wear ear protective devices to reduce harmful effects to your hearing.
WARNING:	Surface temperatures of motor enclosures may reach temperatures which can cause discomfort or injury to personnel accidentally coming into contact with hot surfaces. When installing, protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this precaution could result in bodily injury.
WARNING:	This equipment may be connected to other machinery that has rotating parts or parts that are driven by this equipment. Improper use can cause serious or fatal injury. Only qualified personnel should attempt to install operate or maintain this equipment.
WARNING:	Do not by-pass or disable protective devices or safety guards. Safety features are designed to prevent damage to personnel or equipment. These devices can only provide protection if they remain operative.
WARNING:	Avoid the use of automatic reset devices if the automatic restarting of equipment can be hazardous to personnel or equipment.
WARNING:	Be sure the load is properly coupled to the motor shaft before applying power. The shaft key must be fully captive by the load device. Improper coupling can cause harm to personnel or equipment if the load decouples from the shaft during operation.
WARNING:	UL Listed motors must only be serviced by UL Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere.
WARNING:	Thermostat contacts automatically reset when the motor has slightly cooled down. To prevent injury or damage, the control circuit should be designed so that automatic starting of the motor is not possible when the thermostat resets

MN408

WARNING:	Pacemaker danger – Magnetic and electromagnetic fields in the vicinity of current carrying carrying conductors and permanent magnet motors can result result in a serious health hazard to persons with cardiac pacemakers, metal implants, and hearing aids. To avoid risk, stay way from
WARNING:	Before performing any motor maintenance procedure, be sure that the equipment connected to the motor shaft cannot cause shaft rotation. If the load can cause shaft rotation, disconnect the load from the motor shaft before maintenance is performed. Unexpected mechanical rotation of the motor parts can cause injury or motor damage.
WARNING:	Do not use non UL/CSA listed explosion proof motors in the presence of flammable or combustible vapors or dust. These motors are not designed for atmospheric conditions that require explosion proof operation.
WARNING:	Motors that are to be used in flammable and/or explosive atmospheres must display the UL label on the nameplate along with CSA listed logo. Specific service conditions for these motors are defined in NFPA 70 (NEC) Article 500.
WARNING:	Guards must be installed for rotating parts such as couplings, pulleys, external fans, and unused shaft extensions, should be permanently guarded to prevent accidental contact by personnel. Accidental contact with body parts or clothing can cause serious or fatal injury.
Caution:	To prevent premature equipment failure or damage, only qualified maintenance personnel should perform maintenance.
Caution:	Do not over tension belts. Excess tension may damage the motor or driven equipment.
Caution:	Do not over-lubricate motor as this may cause premature bearing failure.
Caution:	Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.
Caution:	If eye bolts are used for lifting a motor, be sure they are securely tightened. The lifting direction should not exceed a 20° angle from the shank of the eye bolt or lifting lug. Excessive lifting angles can cause damage.
Caution:	To prevent equipment damage, be sure that the electrical service is not capable of delivering more than the maximum motor rated amps listed on the rating plate.
Caution:	If a HI POT test (High Potential Insulation test) must be performed, follow the precautions and procedure in NEMA MG1 and MG2 standards to avoid equipment damage. If you have any questions or are uncertain about any statement or procedure, or if you require additional information please contact your Baldor distributor or an Authorized Baldor Service Center.
Receiving	 Each Baldor Electric Motor is thoroughly tested at the factory and carefully packaged for shipment. When you receive your motor, there are several things you should do immediately. Observe the condition of the shipping container and report any damage immediately to the commercial carrier that delivered your motor. Verify that the part number of the motor you received is the same as the part number listed on your
<u>Handling</u> Caution:	The motor should be lifted using the lifting lugs or eye bolts provided. Do not lift the motor and its driven load by the motor lifting hardware. The motor lifting hardware is adequate for lifting only the motor. Disconnect the load (gears, pumps, compressors, or other driven equipment) from the motor shaft before lifting the motor.
	 Use the lugs or eye bolts provided to lift the motor. Never attempt to lift the motor and additional equipment connected to the motor by this method. The lugs or eye bolts provided are designed to lift only the motor. Never lift the motor by the motor shaft or the hood of a WPI motor. To avoid condensation inside the motor, do not unpack until the motor has reached room temperature (Room temperature is the temperature of the room in which it will be installed). The packing provides insulation from temperature changes during transportation. When lifting a WPII (Weather Proof Type 2) motor, do not lift the motor by inserting lifting lugs into holes on top of the cooling hood. These lugs are to be used for hood removal only.

 greater. Minimum resistance is calculated as follows: Rm = kV + 1 where: (Rm is minimum resistance to ground in Meg-Ohms and kV is rated nameplate voltage defined as Kilo-Volts.) Example: For a 480VAC rated motor Rm = 1.48 meg-ohms (use 5 MΩ). For a 4160VAC rated motor Rm = 5.16 meg-ohms. for Storage 1. Some motors have a shipping brace attached to the shaft to prevent damage during transportation. The shipping brace, if provided, must be removed and stored for future use. The brace must be reinstalled to hold the shaft firmly in place against the bearing before the motor is moved. 2. Store in a clean, dry, protected warehouse where control is maintained as follows: 	Store in a clean. drv. protected warehouse where control is maintained as follows:	age temperatures of 10°C (50°F) to	motor insulation resistance decreases istrict office.	lace new desiccant inside the vapor ba	 Place the shell over the motor and secu Where motors are mounted to machinery, th are fully operable and are at the lowest poin vertical position. Storage

from date of shipment.

failure.

A wooden crate "shell" should be constructed to secure the motor during storage. This is similar to an export box but the sides & top must be secured to the wooden base with lag bolts (not nailed as export boxes are) to allow opening and reclosing many times without damage to the "shell".

Improper motor storage will result in seriously reduced reliability and failure. An electric motor that does not experience regular usage while being exposed to normally humid atmospheric conditions is likely to develop rust in the bearings or rust particles from surrounding surfaces may contaminate the bearings. The electrical insulation may absorb an excessive amount of moisture leading to the motor winding

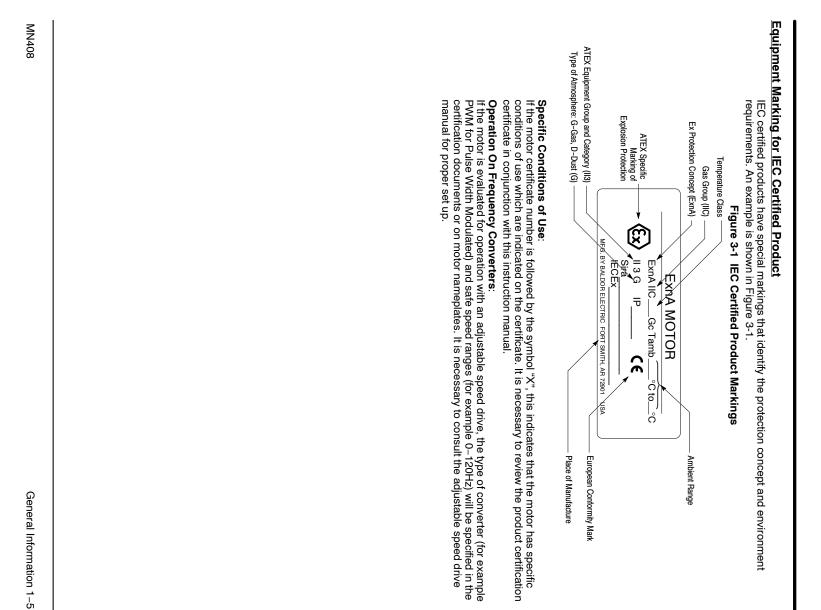

Storage requirements for motors and generators that will not be placed in service for at least six months

Do not lift the assembly using the motor lugs or eye bolts provided. Lugs or eye bolts are designed to lift motor only. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting. If the load is unbalanced (as with couplings or additional attachments) additional slings or other means must be used to prevent tipping. In any event, the load must be secure before lifting.

If the motor must be mounted to a plate with the driven equipment such as pump, compressor etc., it may not be possible to lift the motor alone. For this case, the assembly should be lifted by a sling around the mounting base. The entire assembly can be lifted as an assembly for installation.

4.

1. Remove all packing material. 2. Measure and record the electrical resistance c removal from storage. The insulation resistan recorded when the motor was placed into stor windings and necessitates electrical or mecha	 All Other Motor Types Before storage, the following procedure must be performed. 1. Remove the grease drain plug, if supplied, (opposite the grease fitting) on the b prior to lubricating the motor. 2. The motor with regreasable bearing must be greased as instructed in Section 3 3. Replace the grease drain plug after greasing. 4. The motor shaft must be rotated at minimum of 15 times after greasing. 5. Motor Shafts are to be rotated at least 15 revolutions manually every 3 months added every nine months (see Section 3) to each bearing. 6. Bearings are to be greased at the time of removal from storage. 	 All breather drains are to be fully operable while in storage (drain plus be stored so that the drain is at the lowest point. All breathers and a operable to allow breathing and draining at points other than throug Vertical motors should be stored in a safe stable vertical position. Coat all external machined surfaces with a rust preventing material. An acceptable product for this purpose is Exxon Rust Ban # 392. Carbon brushes should be lifted and held in place in the holders, ab holder fingers. The commutator should be wrapped with a suitable r as a mechanical protection against damage. Non-Regreasable motors with "Do Not Lubricate" on the nameplate should be increase within the bearing even a monte or the store of the protection. 	 Motors with anti-friction bearings are to be greased at the time of going into extended st periodic service as follows: Motors marked "Do Not Lubricate" on the nameplate do not need to be greased befrequences of the storage. Ball and roller bearing (anti-friction) motor shafts are to be rotated manually every 3 greased every 6 months in accordance with the Maintenance section of this manual c. Sleeve bearing (oil lube) motors are drained of oil prior to shipment. The oil reservoirs must be refilled to the indicated level with the specified lubricant, (Maintenance). The shaft should be rotated monthly by hand at least 10 to 15 revolut distribute oil to bearing surfaces. "Provisions for oil mist lubrication" – These motors are packed with grease. Storage are the same as paragraph 5b. "Oil Mist Lubricated" – These bearings are protected for temporary storage by a confinition. If storage for greater than 3 months or outdoor storage is anticipated, connemist system while in storage. If this is not possible, add the amount of grease indication.
Hemove all packing material. Measure and record the electrical resistance of the winding insulation resistance meter at the time of removal from storage. The insulation resistance must not be less than 50% from the initial reading recorded when the motor was placed into storage. A decrease in resistance indicates moisture in the windings and necessitates electrical or mechanical drying before the motor can be placed into service. If resistance is low, contact your Baldor District office. Regrease the bearings as instructed in Section 3 of this manual. Reinstall the original shipping brace if motor is to be moved. This will hold the shaft firmly against the	Other Motor Types ore storage, the following procedure must be performed. Remove the grease drain plug, if supplied, (opposite the grease fitting) on the bottom of each bracket prior to lubricating the motor. The motor with regreasable bearing must be greased as instructed in Section 3 of this manual. Replace the grease drain plug after greasing. The motor shaft must be rotated a minimum of 15 times after greasing. Motor Shafts are to be rotated at least 15 revolutions manually every 3 months and additional grease added every nine months (see Section 3) to each bearing. Bearings are to be greased at the time of removal from storage.	 All breather drains are to be fully operable while in storage (drain plugs removed). The motors must be stored so that the drain is at the lowest point. All breathers and automatic "T" drains must be operable to allow breathing and draining at points other than through the bearings around the shaft. Vertical motors should be stored in a safe stable vertical position. Coat all external machined surfaces with a rust preventing material. An acceptable product for this purpose is Exxon Rust Ban # 392. Carbon brushes should be lifted and held in place in the holders, above the commutator, by the brush holder fingers. The commutator should be wrapped with a suitable material such as cardboard paper as a mechanical protection against damage. Non-Regreaseable Motors 	 Motors with anti-friction bearings are to be greased at the time of going into extended storage with periodic service as follows: Motors marked "Do Not Lubricate" on the nameplate do not need to be greased before or during storage. Ball and roller bearing (anti-friction) motor shafts are to be rotated manually every 3 months and greased every 6 months in accordance with the Maintenance section of this manual. Sleeve bearing (oil lube) motors are drained of oil prior to shipment. The oil reservoirs must be refilled to the indicated level with the specified lubricant, (see Maintenance). The shaft should be rotated monthly by hand at least 10 to 15 revolutions to distribute oil to bearing surfaces. "Provisions for oil mist lubrication" – These motors are packed with grease. Storage procedures are the same as paragraph 5b. "Oil Mist Lubricated" – These bearings are protected for temporary storage by a corrosion inhibitor. If storage for greater than 3 months or outdoor storage is anticipated, connected to the oil mist system while in storage. If this is not possible, add the amount of grease indicated under "Standard Condition" in Section 3, then rotate the shaft 15 times by hand.

Installation & Operation	Section 2
n	

ò

nstallati	nstallation & Uperation
verview	Installation should conform to the National Electrical Code as well as local codes and practices. When other devices are coupled to the motor shaft, be sure to install protective devices to prevent future
	accidents. Some protective devices include, coupling, belt guard, chain guard, shaft covers etc. These protect against accidental contact with moving parts. Machinery that is accessible to personnel should provide further protection in the form of guard rails, screening, warning signs etc.
ocation	It is important that motors be installed in locations that are compatible with motor enclosure and ambient conditions. Improper selection of the motor enclosure and ambient conditions can lead to reduced onerating life of the motor.
	Proper ventilation for the motor must be provided. Obstructed airflow can lead to reduction of motor life. 1. Open Drip-Proof/WPI motors are intended for use indoors where atmosphere is relatively clean, dry, well ventilated and non-corrosive.
	Totally Enclosed and WPII motors may be installed where dirt, moisture or dust are present and in outdoor locations.
	Severe Duty, IEEE 841 and Washdown Duty enclosed motors are designed for installations with high

Page 24 of 46

Б

corrosion or excessive moisture conditions. These motors should not be placed into an environment where there is the presence of flammable or combustible vapors, dust or any combustible material, unless specifically designed for this type of service.

Hazardous Locations are those where there is a risk of ignition or explosion due to the presence of combustible gases, vapors, dust, fibers, or flyings. Facilities requiring special equipment for hazardous locations are typically classified in accordance with local requirements. In the US market, guidance is provided by the National Electric Code.

Location

Mounting

The motor should be installed in a location compatible with the motor enclosure and specific ambient. To allow adequate air flow, the following clearances must be maintained between the motor and any obstruction:

TEFC / TENV (IC0141) Enclosures	S
Fan Cover Air Intake	180 - 210T Frame 1" (25mm)
Fan Cover Air Intake	250 - 449T Frame 4" (100mm)
	IEC 112 – 132 1" (25mm)
	IEC 160 – 280 4" (100mm)
Exhaust	Envelope equal to the P Dimension on the motor dimension sheet
OPEN/Protected Enclosures	
Bracket Intake	Same as TEFC
Frame Exhaust	Exhaust out the sides envelope
	A minimum of the P dimension plus 2" (50mm)
	Exhaust out the end same as intake.

The motor must be securely installed to a rigid foundation or mounting surface to minimize vibration and maintain alignment between the motor and shaft load. Failure to provide a proper mounting surface may cause vibration, misalignment and bearing damage.

Foundation caps and sole plates are designed to act as spacers for the equipment they support. If these devices are used, be sure that they are evenly supported by the foundation or mounting surface. When installation is complete and accurate alignment of the motor and load is accomplished, the base should be grouted to the foundation to maintain this alignment.

The standard motor base is designed for horizontal or vertical mounting. Adjustable or sliding rails are designed for horizontal mounting only. Consult your Baldor distributor or authorized Baldor Service Center for further information

There are applications where grounding the exterior parts of a motor or generator may result in greater hazard by increasing the possibility of a person in the area simultaneously contacting ground and some other nearby live electrical parts of other ungrounded electrical equipment. In portable equipment it is difficult to be sure that a positive ground connection is maintained as the equipment is moved, and providing a grounding conductor may lead to a false sense of security.

some

For motors installed in compliance with IEC requirements, the following minimum cross sectional area of the protective conductors should be used: Select a motor starter and over current protection suitable for this motor and its application. Consult motor starter application data as well as the National Electric Code and/or other applicable local codes.

Minimum cross-sectional area of the corresponding protective conductor,

Cross-sectional area of phase conductors

member. Some motors are supplied with the bonding conductor on the concealed side of the cushion ring to protect the bond from damage. Motors with bonded cushion rings should usually be grounded at the time of installation in accordance with the above recommendations for making ground connections. When

Motors with resilient cushion rings usually must be provided with a bonding conductor across the resilient

point, the motor or generator terminal housing, and the motor or generator frame. In non–USA locations generators, and Article 250 for general information on grounding. In making the ground connection, the

installer should make certain that there is a solid and permanent metallic connection between the ground

consult the appropriate national or local code applicable.

motors with bonded cushion rings are used in multimotor installations employing group fusing or group protection, the bonding of the cushion ring should be checked to determine that it is adequate for the

rating of the branch circuit over current protective device being used.

Doweling & Bolting After proper alignment is verified, dowel pins should be inserted through the motor feet into the foundation. This will maintain the correct motor position should motor removal be required.

(Baldor•Reliance motors are designed for doweling.)

Drill dowel holes in diagonally opposite motor feet in the locations provided

Class II Division 2 / Zone 22 [Equipment Group III, Equipment Protection Level (EPL) Dc] This area classification is one where the risk of exposure to ignitable concentrations of dust are not likely to occur under normal operating conditions and relies heavily on the housekeeping practices within the

In the North American area classification system, Class III exists for fibers and flyings. In the IEC designation, both dusts and flyings are absorbed into Group III.

Sine Wave Power Operation for Division 1 or 2 and Zone 1 or 2 and Zone 21 or 22 Hazardous

installation.

properly connected to a suitable switching device. Note: In the North American area classification sy

considered. In many cases, the internal temperatures are higher than the external temperatures and therefore become the limiting factor in determination of temperature code designation. In these applications, it is very important to use a motor that has been evaluated thermally for use with an inverter or converter, if variable speed operation is desired. Thermostats used for Class I Division 2 and Ex nA motors are used to protect the motor only. For motors using flying lead construction, it is important to use connection lugs and insulate with heat shrink tubing or a double wrap of insulation grade electrical tape to avoid the risk of spark or ignition.
 Class II Division 1 / Zone 21 [Equipment Group III, Equipment Protection Level (EPL) Db]
 This area classification is one where the risk of ignitable concentrations of dust is present at all or some of the time. The protection proof or Ex tD. External surface temperature remains the limiting factor. Thermal limiting devices such as thermostats. Thermistors or RTDs may be provided on these motors to limit the external surface temperature during overload conditions. If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are proveded to a suitable switching device.

Class I Division 2 / Zone 2 Ex nA, [Equipment Protection Level (EPL) Gc] This protection concept relies on having no sources of ignition present such as arcing parts or hot surfaces. For this protection concept, internal temperatures as well as external temperatures are

Explosion proof and Flame proof motors shipped without a conduit box require use of a certified box of suitable dimensions and that is appropriate for the classification.

motor

enclosure and

If thermostats are provided as a condition of certification, it is the installer's responsibility to make sure that these devices are properly connected to a suitable switching device. The ATEX directive requires that motor shutdown on thermal trip be accomplished without an intermediate software command.

Flameproof motors, internationally referred to as Ex d use a protection concept similar to that used in Class I Division 1 motors, with minor differences in the flameproof joints and cable entry designs. Flameproof and explosion proof motors are both type tested. Representative motors are connected to a

Motor load exceeding service factor nameplate value Ambient temperature above nameplate value

Thermal LimitingThermal limiting devices are temperature sensing control components installed inside the motor to limit the internal temperature of the motor frame by interrupting the circuit of the holding coil of the magnetic switch or contactor. They are required for most Division 1 and Zone 1 applications. For Division 2 or Zone 2 applications, motors should be selected that preclude running temperatures from exceeding the ignition temperatures for the designated hazardous material. In Division 2 or Zone 2 classified locations, thermal limiting devices should only be used for winding protection and not considered for limiting all internal motor temperatures to specific ignition temperatures. http://www.iecex.com/service_facilities.htm Explosion proof and flameproof motors achieve their safety based on the mechanical construction – flameproof joints and bearing clearance, and the electrical design including any thermal limiting devices. If it is necessary to repair a flameproof or explosion proof motor, it is critical that the mechanical flameproof joints be maintained. Consult Baldor Electric Company for flameproof joint construction details. Use only Baldor•Reliance supplied parts. Baldor does not recommend reclamation of parts. Since this protection method also relies on temperature being maintained, make sure that any rewinding uses the original electrical designs, including any thermal protection that may be present. In the North American market, recertification programs are offered by Underwriters Laboratories and Canadian Standards Association which allow authorized service shops to mark the rebuilt motors as certified. In the international markets using IEC based requirements, repair should be undertaken only after consulting IEC60079-19 Explosive Atmospheres-Part 19 Equipment repair, overhaul and reclamation. If use of a certified repair facility is desired, consult the IECEX Repair Scheme at Bearing currents can exist in some motors for both line-fed and inverter-fed applications. Larger line-fed motors may require at least one insulated bearing to prevent a flow of current through the bearings. Do not defeat such insulation whether the motor is line-fed or inverter-fed applications. Inverter-fed motors may require additional bearing insulation or even a shaft brush. Do not defeat such features. When the motor and the coupled load are not on a common conductive baseplate, it may also be necessary to electrically bond together the stationary parts of the motor and the coupled equipment. Repair of hazardous certified motors requires additional information, skill, and care. It is the customer's responsibility to select service shops with proper qualifications to repair hazardous location motors. Contact the manufacture for additional repair details. Use only original manufacturer's parts. Repair of Explosion Proof or Flame Proof Motors Class I Division 1 and Zone 1 Equipotential Bonding and Shaft Current Reduction Larger motors (ie WP construction) may require proper bonding between motor enclosures and covers to avoid the risk of stray currents during start up. Fastening methods and bonding straps must not be modified. 22 environment, this excessive temperature motor at any of the following conditions can the motor construction to add any in the connection box and at the s shaft

Record the readings. Immediately investigate any significant decrease in insulation resistance. Check all electrical connectors to be sure that they are tight. ubrication & Bearings Bearing grease will lose its lubricating ability over time, not suddenly. The lubricating ability of a grease (over time) depends primarily on the type of grease, the size of the bearing operates and the severity of the operating conditions. Good results can be obtained if the following recommendations are used in your maintenance program. Type of Grease A high grade ball or roller bearing grease should be used. Recommended grease for standard service conditions is Polyrex EM (Exxon Mobil). Do not mix greases unless compatibility has been checked and verified. 	 WARNING: UL and EX Listed motors must only be serviced by UL or EX Approved Authorized Baldor Service Centers if these motors are to be returned to a hazardous and/or explosive atmosphere. General Inspection Inspect the motor at regular intervals, approximately every 500 hours of operation or every 3 months, whichever occurs first. Keep the motor clean and the ventilation openings clear. The following steps should be performed at each inspection: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Only qualified personnel should attempt the installation, operation and maintenance of this equipment. Check that the motor is clean. Check that the interior and exterior of the motor is free of dirt, oil, grease, water, etc. Oily vapor, paper pulp, textile lint, etc. can accumulate and block motor ventilation. If the motor is not properly ventilated, overheating can occur and cause early motor failure.

Some motor designs use different bearings on each motor end. This is normally indicated on the motor nameplate. In this case, the larger bearing is installed on the motor Drive endplate. For best relubrication results, only use the appropriate amount of grease for each bearing size (not the same for both).

Without Grease Provisions

<u>.</u>__ Note: Only a Baldor authorized and UL or CSA certified service center can disassemble a UL/CSA listed explosion proof motor to maintain it's UL/CSA listing.

- Disassemble the motor.
- N Add recommended amount of grease to bearing and bearing cavity. (Bearing should be about 1/3 full of grease and outboard bearing cavity should be about 1/2 full of grease.)
- ω Assemble the motor.

Sample Relubrication Determination

Assume - NEMA 286T (IEC 180), 1750 RPM motor driving an exhaust fan in an ambient temperature of 43° C and the atmosphere is moderately corrosive.

- <u>.</u> -Table 3-2 list 9500 hours for standard conditions.
- Ņ
- ω Table 3-3 classifies severity of service as "Severe". Table 3-5 shows that 1.2 in³ or 3.9 teaspoon of grease is to be added
- Note: Smaller bearings in size category may require reduced amounts of grease.

Maintenance & Troubleshooting 3-5

Symptom	Possible Causes	Possible Solutions
Motor will not start	Usually caused by line trouble, such as, single phasing at the starter.	Check source of power. Check overloads, fuses, controls, etc.
Excessive humming	High Voltage.	Check input line connections.
	Eccentric air gap.	Have motor serviced at local Baldor service center.
Motor Over Heating	Overload. Compare actual amps (measured) with nameplate rating.	Locate and remove source of excessive friction in motor or load. Reduce load or replace with motor of greater capacity.
	Single Phasing.	Check current at all phases (should be approximately equal) to isolate and correct the problem.
	Improper ventilation.	Check external cooling fan to be sure air is moving properly across cooling fins. Excessive dirt build-up on motor. Clean motor.
	Unbalanced voltage.	Check voltage at all phases (should be approximately equal) to isolate and correct the problem.
	Rotor rubbing on stator.	Check air gap clearance and bearings. Tighten "Thru Bolts".
	Over voltage or under voltage.	Check input voltage at each phase to motor.
	Open stator winding.	Check stator resistance at all three phases for balance.
	Grounded winding.	Perform dielectric test and repair as required.
	Improper connections.	Inspect all electrical connections for proper termination, clearance, mechanical strength and electrical continuity. Refer to motor lead connection diagram.
Bearing Over Heating	Misalignment.	Check and align motor and driven equipment.
	Excessive belt tension.	Reduce belt tension to proper point for load.
	Excessive end thrust.	Reduce the end thrust from driven machine.
	Excessive grease in bearing.	Remove grease until cavity is approximately 3/4 tilled.
	Insufficient grease in bearing.	Add grease until cavity is approximately 3/4 filled.
	Dirt in bearing.	Clean bearing cavity and bearing. Repack with correct grease until cavity is approximately 3/4 filled.
Vibration	Misalignment.	Check and align motor and driven equipment.
	Rubbing between rotating parts and stationary parts.	Isolate and eliminate cause of rubbing.
	Rotor out of balance.	Have rotor balance checked are repaired at your Baldor Service Center.
	Resonance.	Tune system or contact your Baldor Service Center for assistance.
Noise	Foreign material in air gap or ventilation openings.	Remove rotor and foreign material. Reinstall rotor. Check insulation integrity. Clean ventilation openings.
Growling or whining	Bad bearing.	Replace bearing. Clean all grease from cavity and new bearing. Repack with correct grease until cavity is approximately ³ / ₄ filled.

Safety Notice Be sure to read and understand all of the Safety Notice statements in MN408. A copy is available http://www.baldor.com/support/literature_load.asp?ManNumber=MN408 a

ACCEPTANCE

Thoroughly inspect this equipment before accepting shipment from the transportation company. If any damage shortage is discovered do not accept until noted on the SAFETY freight bill. Report all damage to the freight carrier. 9

Eye bolts, lifting lugs or lifting openings, if provided, are intended only for lifting the motor and motor mounted standard accessories not exceeding, in total 30% of the motor weight. These lifting provisions should never be used when lifting or handling the motor and driven equipment. Eye bolt lifting capacity rating is based on a lifting alignment coincident with eye bolt center line. Eye bolt capacity reduces as deviation from this alignment is increased. Be sure eye bolts are tight and prevented from turning before lifting.

INSTALLATION OUTSIDE THE USA: Refer to MN408 and MN1383 for Compliance with European Directives. Copies are available at:

MOTOR ENCLOSURE http://www.baldor.com/support/literature_load.asp

ODP, combustible materials. Open motors can emit flame and/or molten metal in the event of insulation failure. dry locations with adequate supply of cooling air. These motors should not be used in the presence of flammable or Open drip proof motors are intended for use in clean

indoor and outdoor locations. moisture, dirf and/or corrosive materials are present in TEFC, totally enclosed motors are intended for use where

Explosion protected motors, as indicated by a Nationally Recognized Testing Laboratory Certification mark and marking with Class, Division and Temperature Code are intended for installation in hazardous locations as described in Article 500 of the NEC. Refer to MN408 for more details.

MOUNTING

Foot mounted machines should be mounted to a rigid foundation to prevent excessive vibration. Shims may be used if location is uneven. Flange mounted machines should be properly seated and aligned. Note: If improper rotation direction is detrimental to aligned, check rotation direction prior to coupling the load to the load, check the motor shaft.

premature bearing failure or shaft breakage. **Direct coupled** machines should be carefully aligned and the shaft should rotate freely without binding. For V-belt drive, mount the sheave pulley close to the motor housing. Allow clearance for end to end movement of the motor shaft. Do not overtighten belts as this may cause

GENERAL The user must select a motor starter and overcurrent protection suitable for this motor and its application. Consult motor starter application data as well as the National Electric Code and/or applicable local codes. Special motors for use by United States Government including special specifications, master plans, etc. refer to the applicable master plans and specifications involved lectric

and prevent the shaft block must be installed to prevent axial movement reshipped alone or installed to another piece of equipment remove blocking before operating the motor. If motor is to be On motors received from the factory with the shaft blocked, brinelling of the bearings during shipment

MN416

ESTING

Depending on storage conditions it may be necessary to regrease or change rusted bearings. Contact Baldor District Office if resistance is less than 5 meg ohms. If the motor has been in storage for an extensive period or has been subjected to adverse moisture conditions, check the motor insulation resistance with a meg ohm meter.

WARNING: Do not touch electrical connections before

WARNING: Be sure the system is properly grounded before applying power. Electrical shock can you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury.

cause serious or fatal injury.

INSTALLATION

This motor must be installed Electric Code, NEMA MG-2, WIRING in accordance with National IEC standards and local codes

Connect the motor as shown in the connection diagrams. If this motor is installed as part of a motor control drive system, connect and protect the motor according to the control manufacturers diagrams. Refer to MN408 for additional details on lead marking. The wiring, fusing and grounding must comply with the National Electrical Code or IEC and local codes. When the motor is connected to the load for proper direction of rotation and started, it should start quickly and run smoothly. If not, stop the motor immediately and operation and compare the measured current with the motor, motor connections are not correct or the load is heavy. Check the motor current after a few minutes of determine the cause. Possible causes are: low voltage at the nameplate rating. is too

the ground point, the motor or generator terminal housing, and the motor or generator frame. In non-USA locations consult the appropriate national or local code applicable. **GROUNDING** Ground the motor according to NEC and local codes. In the USA consult the National Electrical Code, Article 430 for information on grounding of motors and generators, and Article 250 for general information on grounding. In making the ground connection, the installer should make certain that ADJUSTMENT there is a solid and permanent metallic connection between

have no adjustable parts. The neutral is adjustable on some DC motors. AC motors

Noise

For specific sound power or pressure level information, contact your local Baldor representative.

VIBRATION

This motor is balanced to NEMA MG1, Part 7 standard

BRUSHES (DC Motors) Periodically, the brushes should be inspected and all brush dust blown out of the motor. If a brush is worn $1/_2$, (length specified in renewal parts data), replace the brushes. Reassemble and seat the new brushes using a brush seating stone. Be sure the rocker arm is set on the neutra

INSPECTION

Before connecting the motor to an electrical supply, inspect for any damage resulting from shipment. Turn the shaft by hand to ensure free rotation. Motor leads must be isolated before the shaft will turn freely on permanent magnet motors. DRAIN PLUGS

motor has special stainless steel drains). All dra located in the lowest portion of the ends shields. non-ventilated motors, the plugs in the lowest portion of the ends shields should be removed for operation (unless the each endplate for various motor mounting configurations. Condensation drain plugs are provided at four points on For Washdown and totally enclosed, fan cooled or All drains are

MOUNTING

Mount the motor on a foundation sufficiently rigid to prevent excessive vibration. Grease lubricated ball bearing motors may be mounted with the feet at any angle. After careful alignment, bolt motor securely in place. Use shim to fill any unevenness in the foundation. Motor feet should sit solidly on the foundation before mounting bolts are tightened.

7 **7** (Ingress Protection)

IP designations include two numerals, the first characteristic numeral is for ingress solid bodies and from dust. The second for ingress protection from liquid – water. Motors marked less than IP23 require additional protection from water.

GUARDING

After motor installation is complete, a guard of suitable dimensions must be constructed and installed around the motor/gearmotor. This guard must prevent personnel from coming in contact with any moving parts of the motor or drive the motor. assembly but must allow sufficient cooling air to pass over

If a motor mounted brake is installed, provide proper safeguards for personnel in case of brake failure. plates or lids, must be installed before operating the motor. Brush inspection plates and electrical connection cover

STARTING

loose rotating parts to prevent them from flying off. Check direction of rotation before coupling motor to load. The motor should start quickly and run smoothly and with little noise. If the motor should fail to start the load may be been miswired. In any case immediately shut motor off and too great for the motor, the voltage is low or the motor has Before starting motor remove all unused shaft keys and investigate the cause.

ROTATION To reverse the direction of rotation, disconnect and lockout power and interchange any two of the three AC power leads for three phase motors. For two-phase four wire, disconnect and lockout power and interchange the AC line leads on any one phase. For two phase three wire, disconnect and lockout one phase for two phase three wire, disconnect and lockout leads

Maintenance Procedures

Page 43 of 46

- WARNING: WARNING: Do not touch electrical connections before you first ensure that power has been disconnected. Electrical shock can cause serious or fatal injury. Surface temperatures of motor enclosures
- accidentally coming into contact with hot surfaces. Protection should be provided by the user to protect against accidental contact with hot surfaces. Failure to observe this discomfort or injury to personnel may reach temperatures which can cause precaution could result in bodily injury.

Lubrication Information

lubricated at the factory. Motors that do not have regrease capability are factory lubricated for the normal life of the bearings. Washdown motors can not be lubricated. This is a ball or roller bearing motor. The bearings have beer

Lubricant

Polyrex EM unless stated on nameplate. Do not mix lubricants due to possible incompatibility. Look for signs of lubricant incompatibility, such as extreme soupiness visible from the grease relief area. If other greases are preferred, check with local Baldor representative for recommendations. Baldor motors are pregreased, normally with Mobil
